

Drug and Substance Abuse Treatment

Violet Allen-Glass, Isis Ramirez, Kaleigh Riggs, Jinchen Ye

Introduction

Source: Center for Behavioral Health Statistics and Quality Substance Abuse and Mental Health Services Administration

Data: Treatment Episode Data Set- Admissions for 2016 (1,699,261 observations, 62 variables)

Each observation represents a person being admitted for substance or drug abuse to a publicly funded facility. Omitted from this data were the states Georgia and Oregon, because they did not report sufficient data in 2016.

Introduction

Secondary Data

Source: Centers for Disease Control and Prevention (CDC)

Data: National Health Interview Survey (NHIS) (33,208 observations, 805 variables)

Each observation represents a person being interviewed about their health status including physical, and mental health.

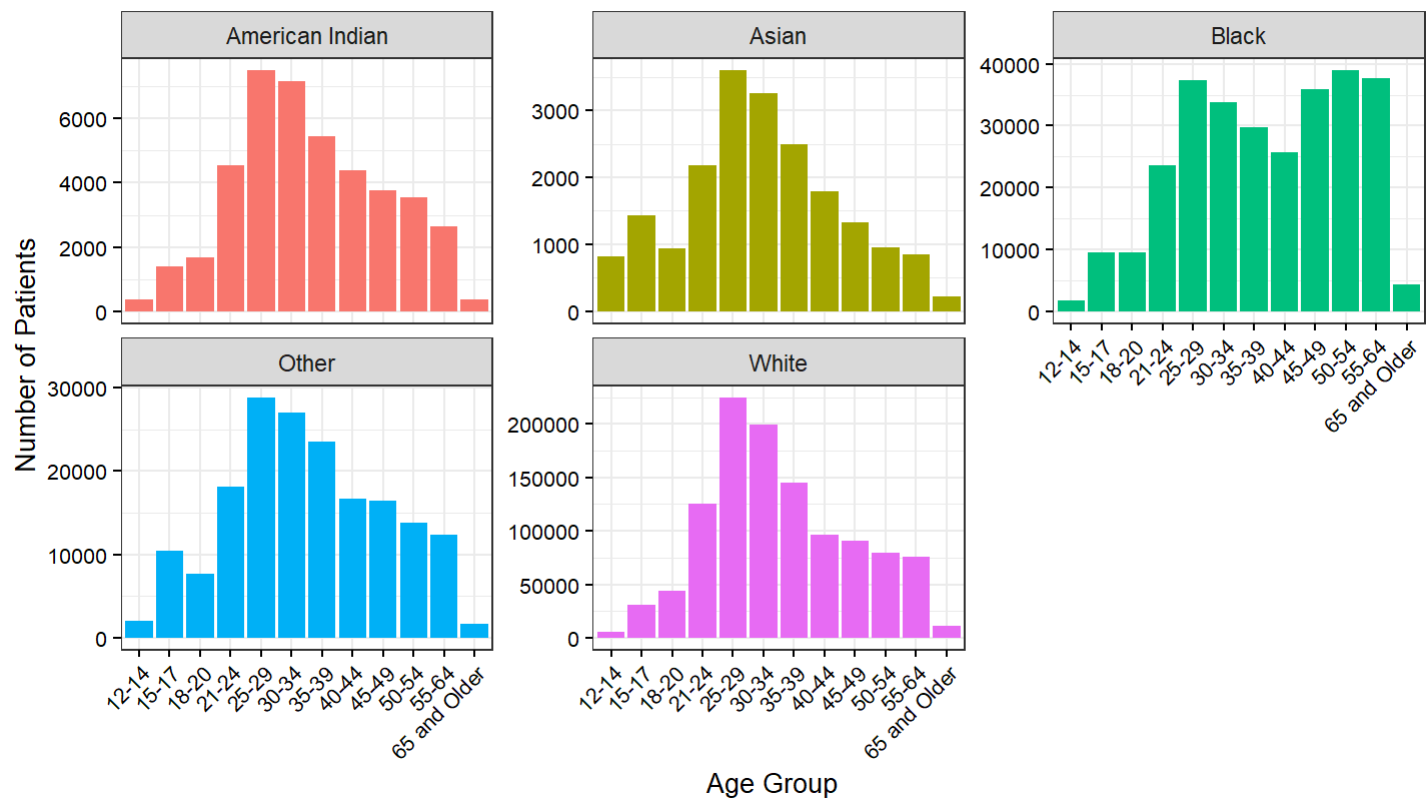

Mental Health & Substance Abuse

Depression Status	Proportion
Depression	0.39
No depression	0.61

Age

Admissions by Age and Race

Employment Status

**Employment Status
by Race**

American Indian

Asian

Black

White

Other

Chi-Square Hypothesis Test

The assumptions of the test, all of which were met, were that:

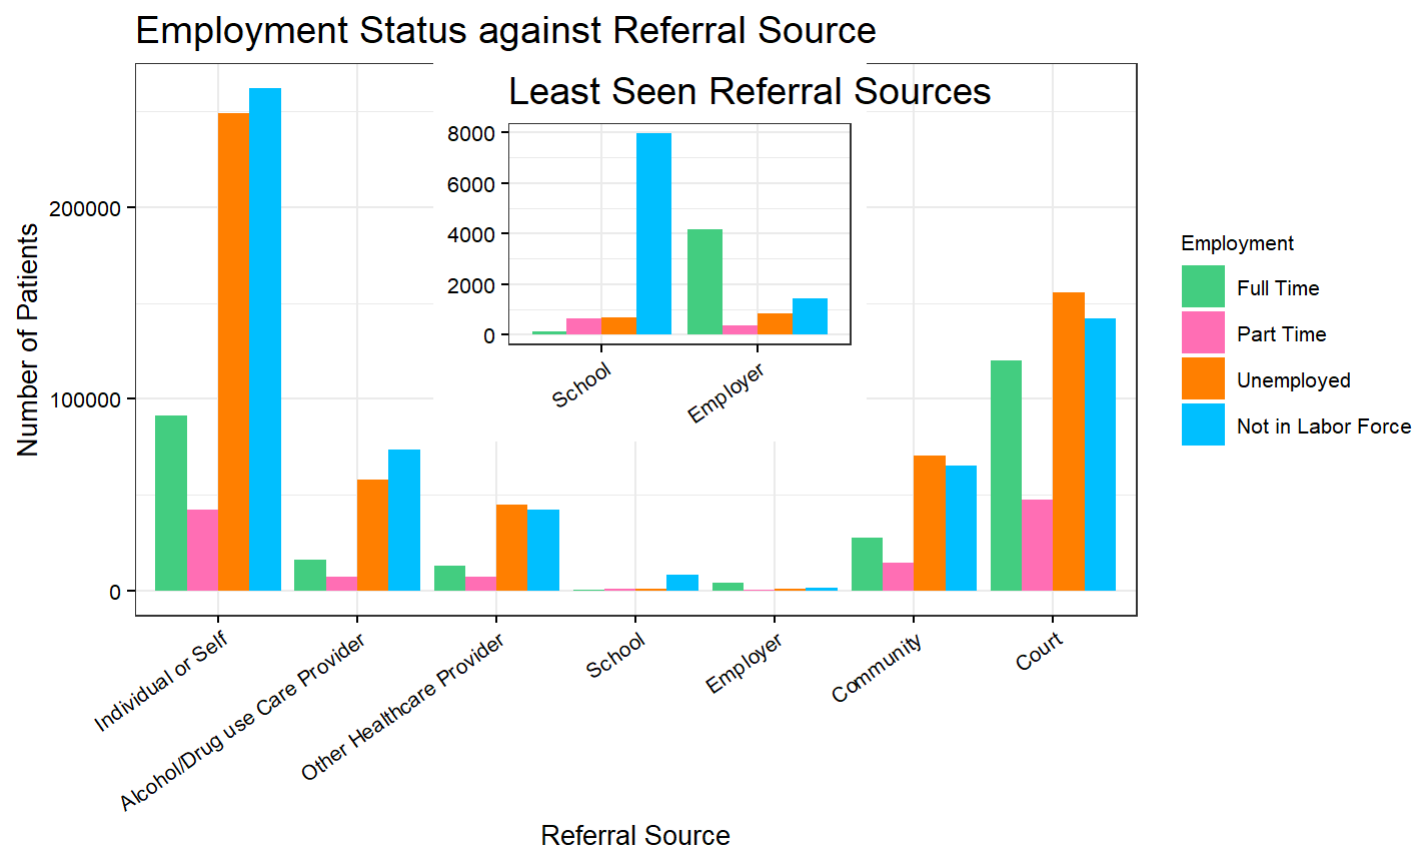

1. We were analyzing count data
2. Variables were mutually exclusive
3. Each subject contributed to only one cell
4. Independence
5. Categorical data or (as we will see later) interval collapsed data
6. Expected value of at least 80% of cells was greater than or equal to 5
7. Expected value of all cells was greater than 1

Our null hypothesis is that no association exists among the two categorical variables, and our alternative is that there is at least one association.

Drug Experience

Introduction

We scraped 1,083 Reddit comments from a page where drug users talked about what drugs they have tried and how they felt.

Positive/Negative Word Association

Mining Reddit comments to determine emotions and experiences.

Positive: joy, happy, amazing, incredible, satisfaction

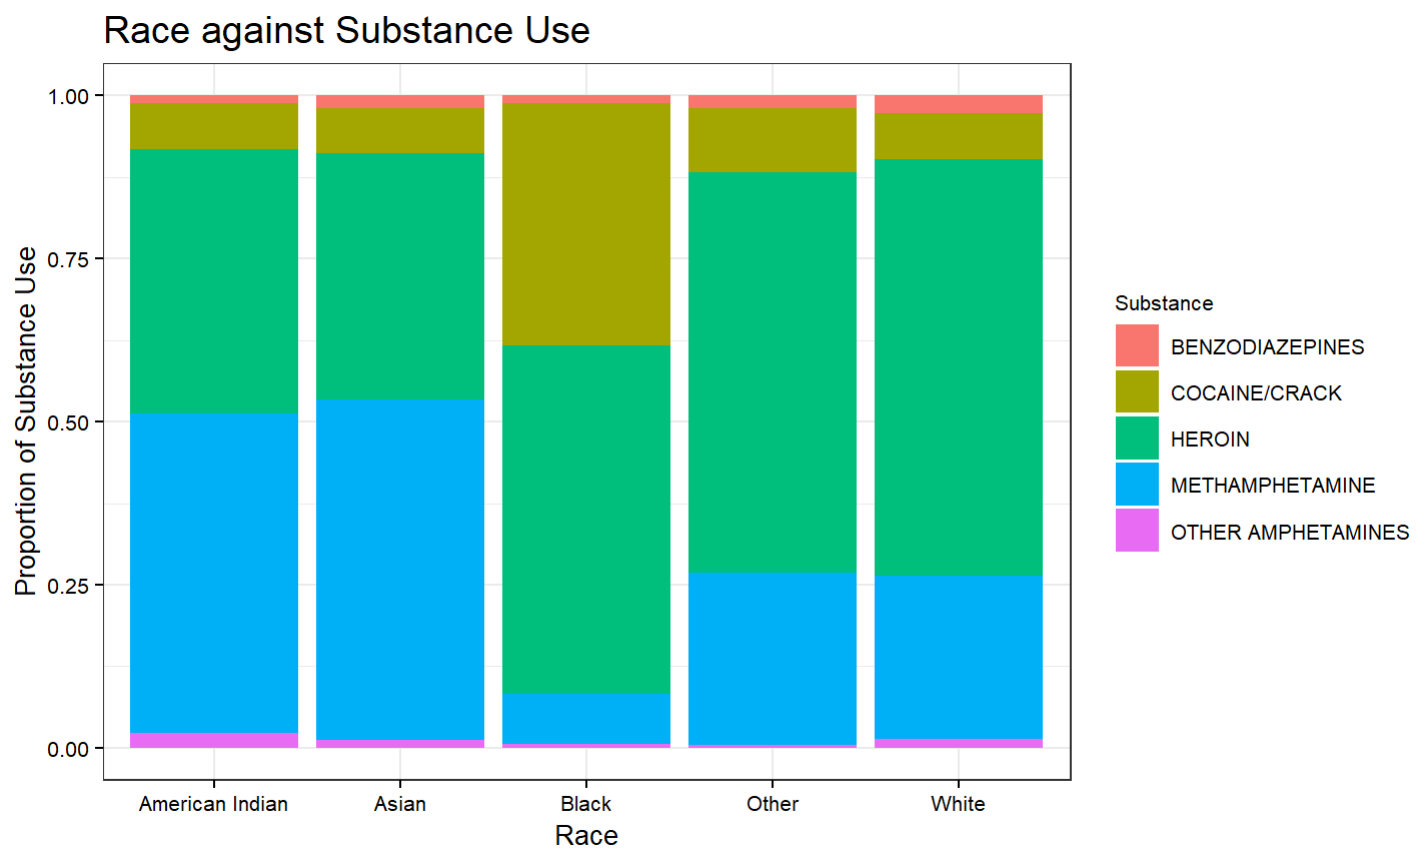

Negative: fear, scary, hate, regret, miserable

Drug Experience

Benzodiazepines includes Xanax, Diazepam, Valium.
Other amphetamines includes speed, adderall, ritalin.

Drug	Positive Words Proportion	Negative Words Proportion
Meth	0.08	0.36
Benzodiazepines	0.17	0.21
Other Amphetamines	0.15	0.30
Cocaine	0.11	0.24
Heroin	0.26	0.41

Admissions by Drug

Conclusion

- White and Other races suffer from depression the longest
- The age that Black patients are admitted does not taper down in older years, but instead seems bi-modal with a second peak at ages 50-54
- Most patients are unemployed/not in labor force
- Self-referral & court-referral were most common
- Strongest negative correlation for race and wait time is between the American Indian race and wait time of 1-7 days
- Most races were admitted for heroin and meth, and heroin had highest proportion of positive experiences
